

Report CIS PA5

I started this problem by taking the input of the meshFile. There was two inputs, the first was Indices and the second was vertices.

The vertices of the mesh file was same as the vertices of the mode =0 file (Problem5Modes.txt). The rest of the modes were not the same.

I kept the indices same as from the meshFile and using that first I calculated the corresponding coordinates of each vertices of the triangle. There was total 3135 indices give for each mode.

The total modes were 6 i.e. from mode 1 to mode 6.

The mode =0 was taken as seperate.

For mode = 0

With the PA4 workflow, I performed the rigid registration and calculated the Freg. For that i used the two point clouds as S_k and C_k . Before performing the rigid registration, I calculated the points on the triangle mesh as C_k . For the initial guess Freg was identity(4).

In the trianglePoint.py we have calculated the q_{0k} also alongwith ck . i.e. using the C_k i have calculated the q_{0k} . So the function "closestPoint" actually returns the two values ie. q_{0k} and ck . For the calculation of q_{0k} , I first calculated the barycentric coordinates, which were l_1, l_2, l_3 for the point(ck) and the three vertices of the triangle(ms, mu, mt).

This is further explained in mathematics for calculation of q_{0k} .

For the calculation of the q_{mk} , we calculated it as $q_{1k}, q_{2k}, q_{3k}, q_{4k}, q_{5k}, q_{6k}$. with the number representing the mode. It was calculated by multiplying barycentric coordinate with triangle vertices. Barycentric coordinates were kept same for different modes. Just they varied with different vectors (k) given in the same mode.

Calculation of mode weight

We already had calculated the S_k and q_k also we had the q_m . Here we used the least square calculation for finding the six lambdas i.e. $\lambda_1, \lambda_2, \lambda_3, \lambda_4, \lambda_5, \lambda_6$.

after 1 iteration we updated the F_{reg} by using the $q_{0,k} + \sum \lambda_m q_{m,k}$ as one point cloud and d_k as the second.

and I again calculated the S_k and C_k with the new F_{reg} .

Mathematics

the l_1, l_2, l_3 represents the barycentric coordinates of \vec{c}_k on the triangle formed by vertices $\vec{m}_{0,s}, \vec{m}_{0,t}, \vec{m}_{0,u}$. for the mode = 0.

$$\vec{q}_{0,k} = l_1 * \vec{m}_{0,s} + l_2 * \vec{m}_{0,t} + l_3 * \vec{m}_{0,u}$$

Calculation of q_m

$$\vec{q}_{m,k} = l_1 * \vec{m}_{m,s} + l_2 * \vec{m}_{m,u} + l_3 * \vec{m}_{m,t}$$

Calculation of S_k

$$\vec{s}_k = F_{reg} \bullet \vec{d}_k$$

calculation of mode weight

$$F_{reg} \bullet d_k = q_{0,k} + \sum \lambda_m q_{m,k}$$

calculation of d_k

$$d_k = F_{b,k}^{-1} F_{A,k} A_{tip}$$

Calculation of C_k with F_{reg}

$$c_k = F_{reg} \bullet d_k$$

Unit Test

1. Barycentric Coordinate

Triangle vertices = a,b,c

$$\begin{aligned}a &= [1, 1, 3] \\b &= [-1, 1, 3] \\c &= [0, -1, 3]\end{aligned}$$

$$Point = [0.3, 0.4, 3]$$

$$Barycentriccoordinate = "$$

"

"

"

$$point = \lambda_1 * a + \lambda_2 * b + \lambda_3 * c$$

$$[0.3, 0.4, 3] = 0.499 * [1, 1, 2] + 0.2 * [3, 6, 1] + 0.2999 * [3, 3, 3]$$

And the sum of $\lambda_1 + \lambda_2 + \lambda_3 = 1$

Structure of the code

There are total 7 modules in the ciscode folder.

I'm using the code for ICP from the PA4.

Modules

barycentric.py

| **barycentric_coordinates((point, a, b, c))**

icp.py

| **best_fit_transform()** ← Perform the point cloud registration
| **nearest_neighbor()** ← calculates the nearest neighbor
| **icp()** ← Main function for calculating the ICP

registration.py

PointCloud() ← performs point cloud registration
frameInv() ← Calculates the inverse of the frame

trianglePoints.py

TriclosestPoint() ← This is the main function for calculation the closest point using the bounding box method
closestPoint() ← this function calls the TriClosestPoint function and it gives the input like the triangle vertices and point sk.

Result for Unknown Data

given at the end of the pdf

Discussion of result

The result is not very accurate because i run the code for just one iteration.

The calculated answer by my program was having only very little error. Like the first value was -10.23 in the actual answer of PA5-A-Debug and my answer was -10.334.

This error was because i run the program for just one iteration. Since for one iteration only, the time taken to calculate it was too long. Hence can't perform many iteration for the problem.

Also in the ICP, I limited the iteration upto 20. This can also be the one of major source of the error.

In addition to it, I run the code for overall 20 iteration and updating the Freg, but when it comes with the 400 sample file it took 10 min to run just one file (for 400 sample).

Otherwise, I expect the error would be low if calculated for all values.
